

Massachusetts eHealth Collaborative  
Clinical Requirements Workgroup  
Overview

Charter

Identify the minimal and optimal functional requirements for the electronic health record system (including ambulatory EMR's, hospital information systems, local health information infrastructures, and medical decision support) needed to improve the quality, safety, and efficiency of clinical practice, while protecting each patient's privacy and providing the ability to report on these improvements for the demonstration pilots.

Key Deliverables

- Functional requirements for the ambulatory electronic health record applications, including among others, medical decision support, patient management workflow and reporting capabilities
- Functional requirements for hospital EHR/ CPOE applications including among others, medical decision support, patient management workflow and reporting capabilities
- Functional requirements for a local health information infrastructure to exchange healthcare information between healthcare organization within the community
